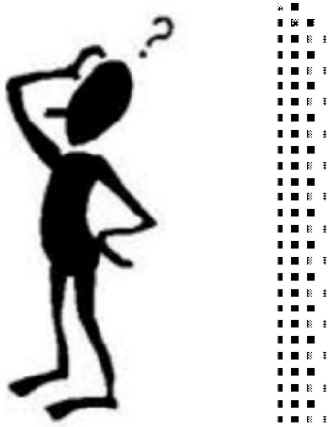
Antibiotic Dosing in Critically Ill Adult Patients Receiving Continuous Renal Replacement Therapy

Robin L. Trotman,[1] John C. Williamson,[1] D. Matthew Shoemaker,[2] and William L. Salzer[2]

Drug	Dosage, by type of renal replacement therapy: CVVH	CVVHD or CVVHDF
Amphotericin B formulation		
Deoxycholate	0.4–1.0 mg/kg q24h	0.4–1 mg/kg q24h
Lipid complex	3–5 mg/kg q24h	3–5 mg/kg q24h
Liposomal	3–5 mg/kg q24h	3–5 mg/kg q24h
Acyclovir	5–7.5 mg/kg q24h	5–7.5 mg/kg q24h
Ampicillin-sulbactam[a]	3 g q12h	3 g q8h
Aztreonam	1–2 g q12h	2 g q12h
Cefazolin	1–2 g q12h	2 g q12h
Cefepime	1–2 g q12h	2 g q12h
Cefotaxime	1–2 g q12h	2 g q12h
Ceftazidime	1–2 g q12h	2 g q12h
Ceftriaxone	2 g q12–24h	2 g q12–24h
Clindamycin	600–900 mg q8h	600–900 mg q8h
Ciprofloxacin[b]	200 mg q12h	200–400 mg q12h
Colistin	2.5 mg/kg q48h	2.5 mg/kg q48h
Daptomycin	4 or 6 mg/kg q48h	4 or 6 mg/kg q48h
Fluconazole[b]	200–400 mg q24h	400–800 mg q24h[c]
Imipenem-cilastatin[d]	250 mg q6h or 500 mg q8h	250 mg q6h, 500 mg q8h, or 500 mg q6h
Levofloxacin[b]	250 mg q24h[e]	250 mg q24h[e]
Linezolid[b]	600 mg q12h	600 mg q12h
Meropenem	1 g q12h	1 g q12h
Moxifloxacin	400 mg q24h	400 mg q24h
Nafcillin or oxacillin	2 g q4–6h	2 g q4–6h
Piperacillin-tazobactam[f]	2.25 g q6h	2.25–3.375 g q6h
Ticarcillin-clavulanate[g]	2 g q6–8h	3.1 g q6h
Vancomycin	1 g q48h[e]	1 g q24h[e]
Voriconazole[h]	4 mg/kg po q12h	4 mg/kg po q12h

Is it so simple?



Variability of antibiotic concentrations in critically ill patients receiving continuous renal replacement therapy: A multicentre pharmacokinetic study*

Crit Care Med 2012 Vol. 40, No. 5

Darren M. Roberts, PhD; Jason A. Roberts, PhD; Michael S. Roberts, PhD; Xin Liu, PhD; Priya Nair, FCICM; Louise Cole, PhD; Jeffrey Lipman, MD; Rinaldo Bellomo, MD; on behalf of the RENAL Replacement Therapy Study Investigators

Table 4. Percentage of dosing intervals (n = 40) achieving the antibiotic therapeutic targets

Antibiotic and Number of Samples	Lower Therapeutic Target[a] (%)	Higher Therapeutic Target[b] (%)
Meropenem (n = 17)	100	76
Piperacillin (n = 7)	100	86
Vancomycin (n = 10)	30	0
Ciprofloxacin (n = 6)	100	83

Table 2. Dose regimens administered to the study participants

Antibiotic	Dose	Cases
Meropenem	500 mg every 8 hrs	8
	500 mg every 12 hrs	1
	1000 mg every 8 hrs	4
	1000 mg every 12 hrs	4
Piperacillin	4000 mg every 6 hrs	4
	4000 mg every 8 hrs	1
	4000 mg every 12 hrs	1
	Unclear	1
Tazobactam	500 mg every 6 hrs	2
	500 mg every 8 hrs	1
	500 mg every 12 hrs	3
	Unclear	1
Vancomycin	1000 mg once daily	10
Ciprofloxacin	200 mg every 8 hrs	2
	200 mg every 12 hrs	1
	400 mg every 12 hrs	2
	400 mg every 8 hrs	1

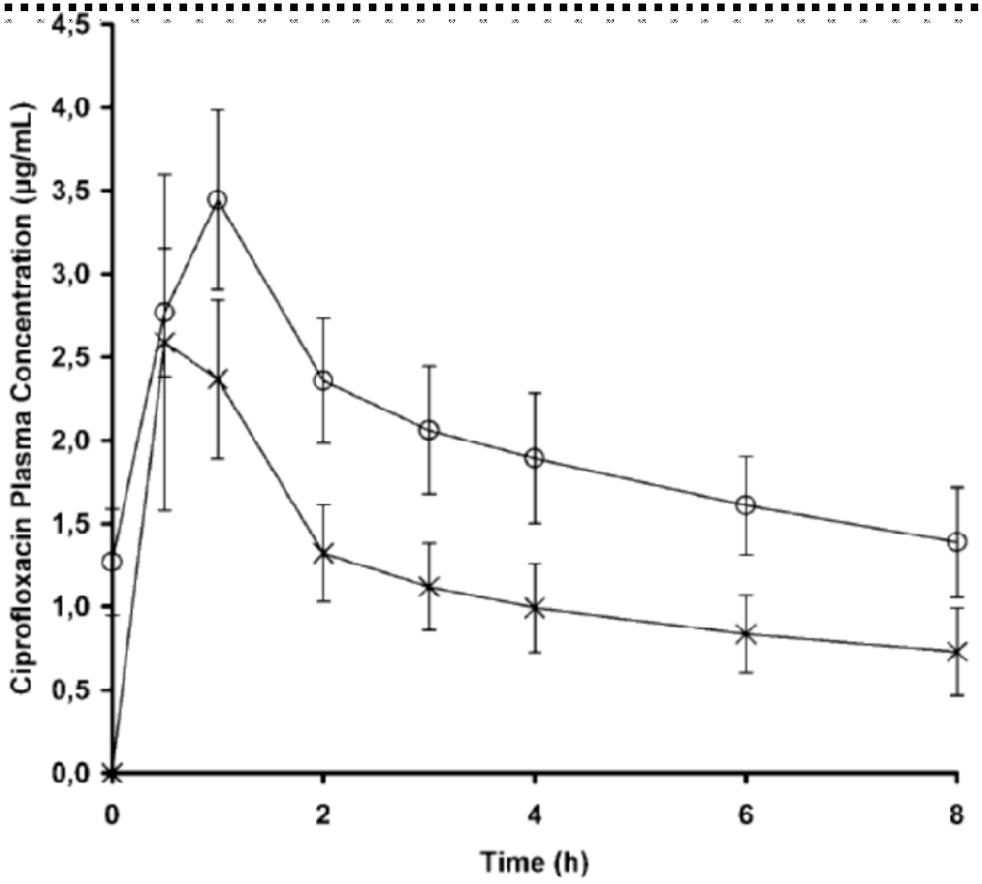
Pharmacokinetics of ciprofloxacin in ICU patients on continuous veno-venous haemodiafiltration

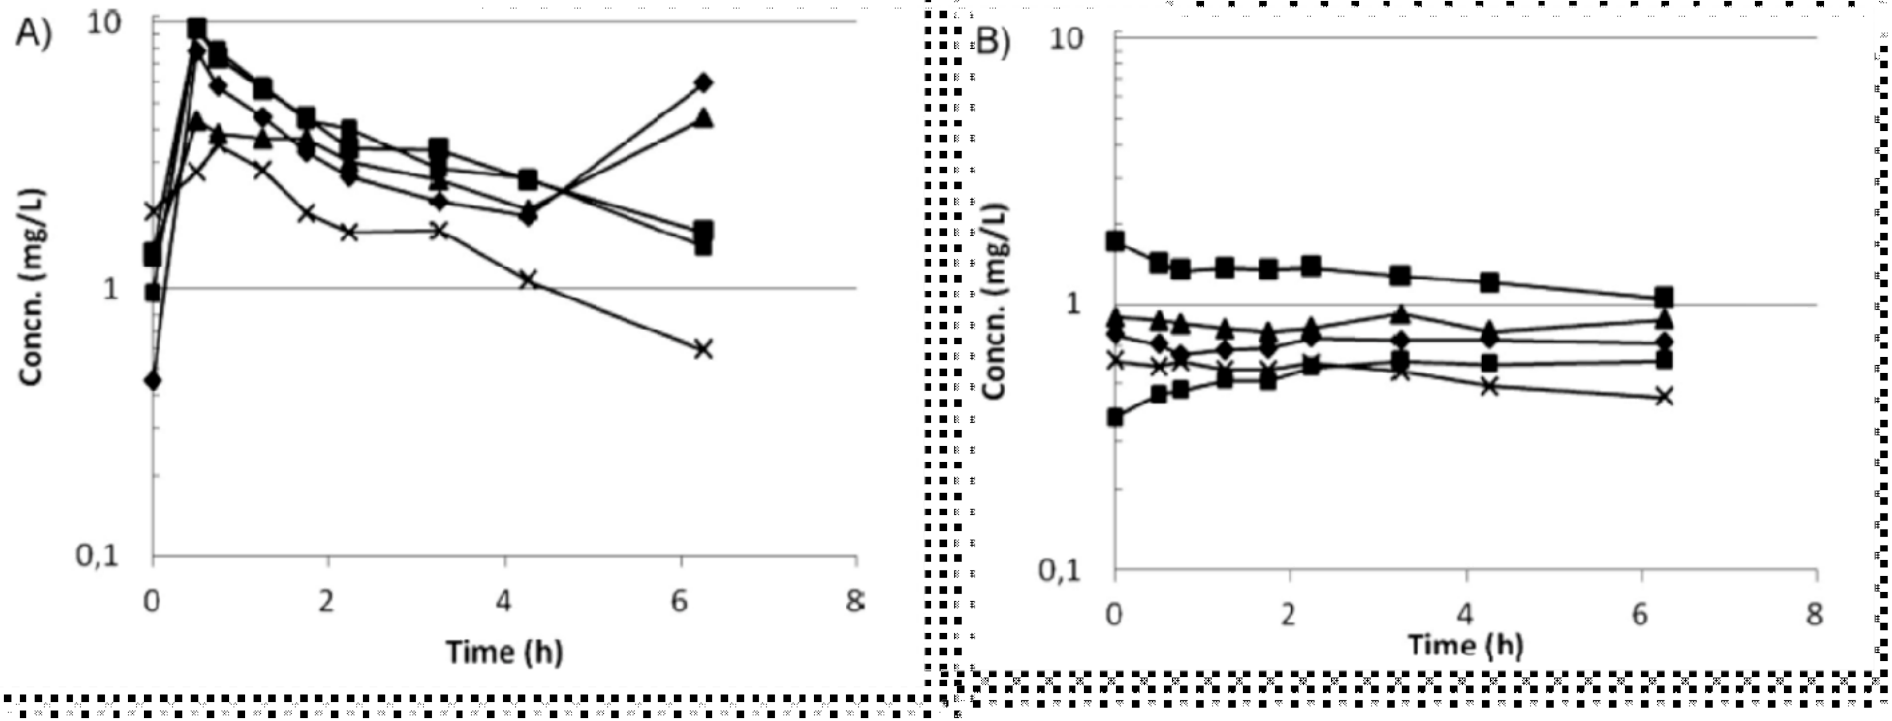


200 mg tid
Is it enough?

Colistin Methanesulfonate and Colistin Pharmacokinetics in Critically Ill Patients Receiving Continuous Venovenous Hemodiafiltration

Matti Karvanen,[a] Diamantis Plachouras,[b] Lena E. Friberg,[c] Elisabeth Paramythiotou,[d] Evangelos Papadomichelakis,[d] Ilias Karaiskos,[b] Iraklis Tsangaris,[d] Apostolos Armaganidis,[d] Otto Cars,[a] Helen Giamarellou[b]

Antimicrobial Agents and Chemotherapy · January 2013 · Volume 57 · Number 1

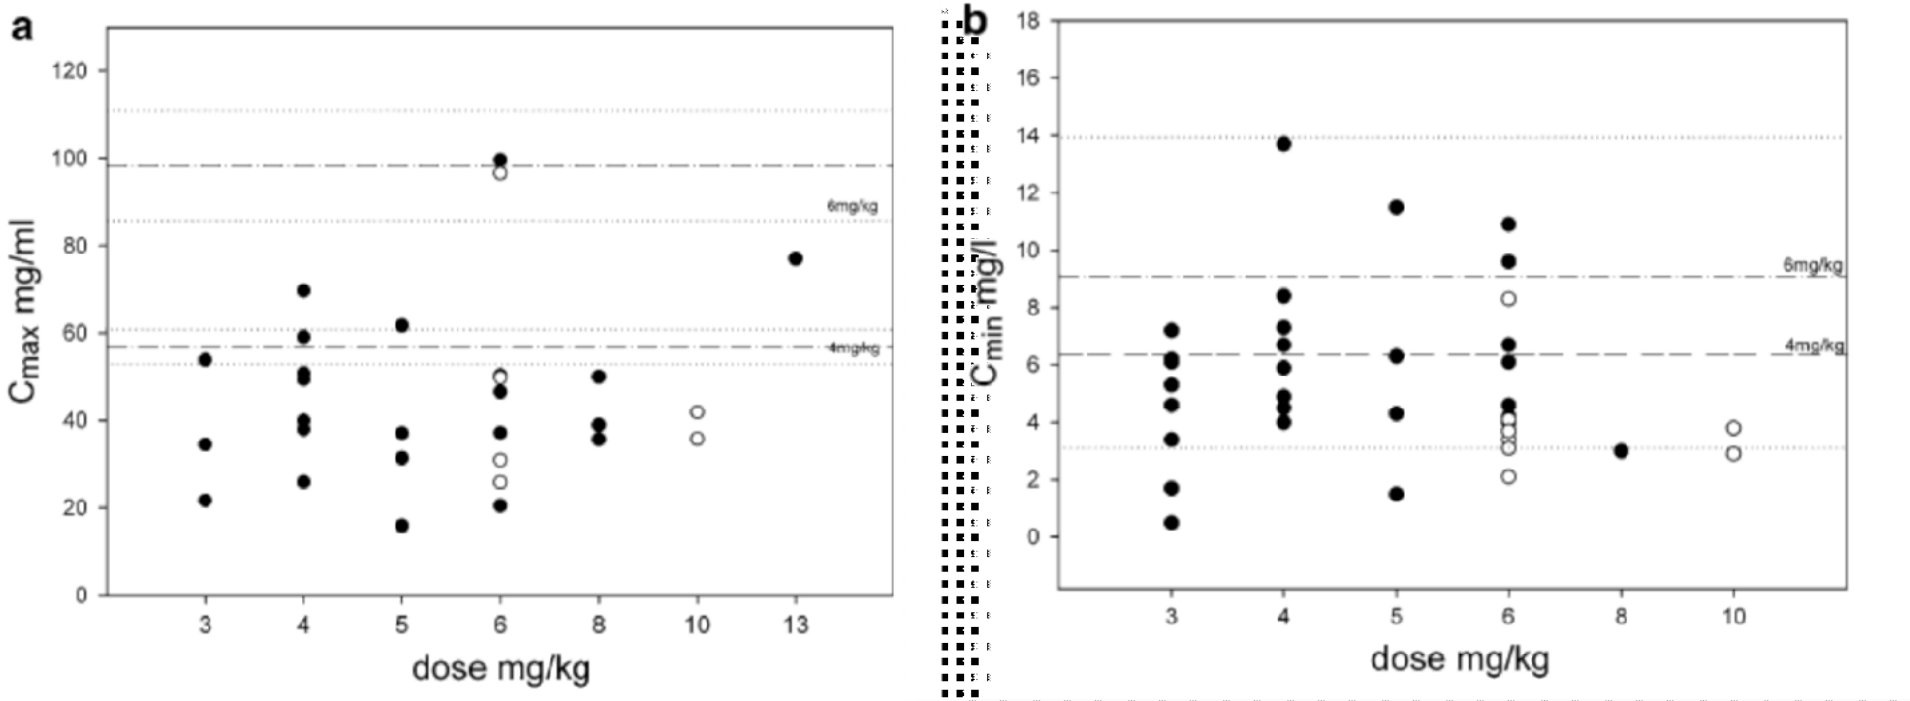


Colistin concentrations were below the current MIC breakpoints, and the area under the concentration-time curve for the free, unbound fraction of the drug over 24 h in the steady state divided by the MIC (fAUC/MIC) was lower than recommended, suggesting that a dosage regimen of 160 mg CMS every 8 h (q8h) is inadequate

Experience with daptomycin daily dosing in ICU patients undergoing continuous renal replacement therapy

B. Preiswerk · A. Rudiger · J. Fehr · N. Corti

Infection (2013) 41:553–557

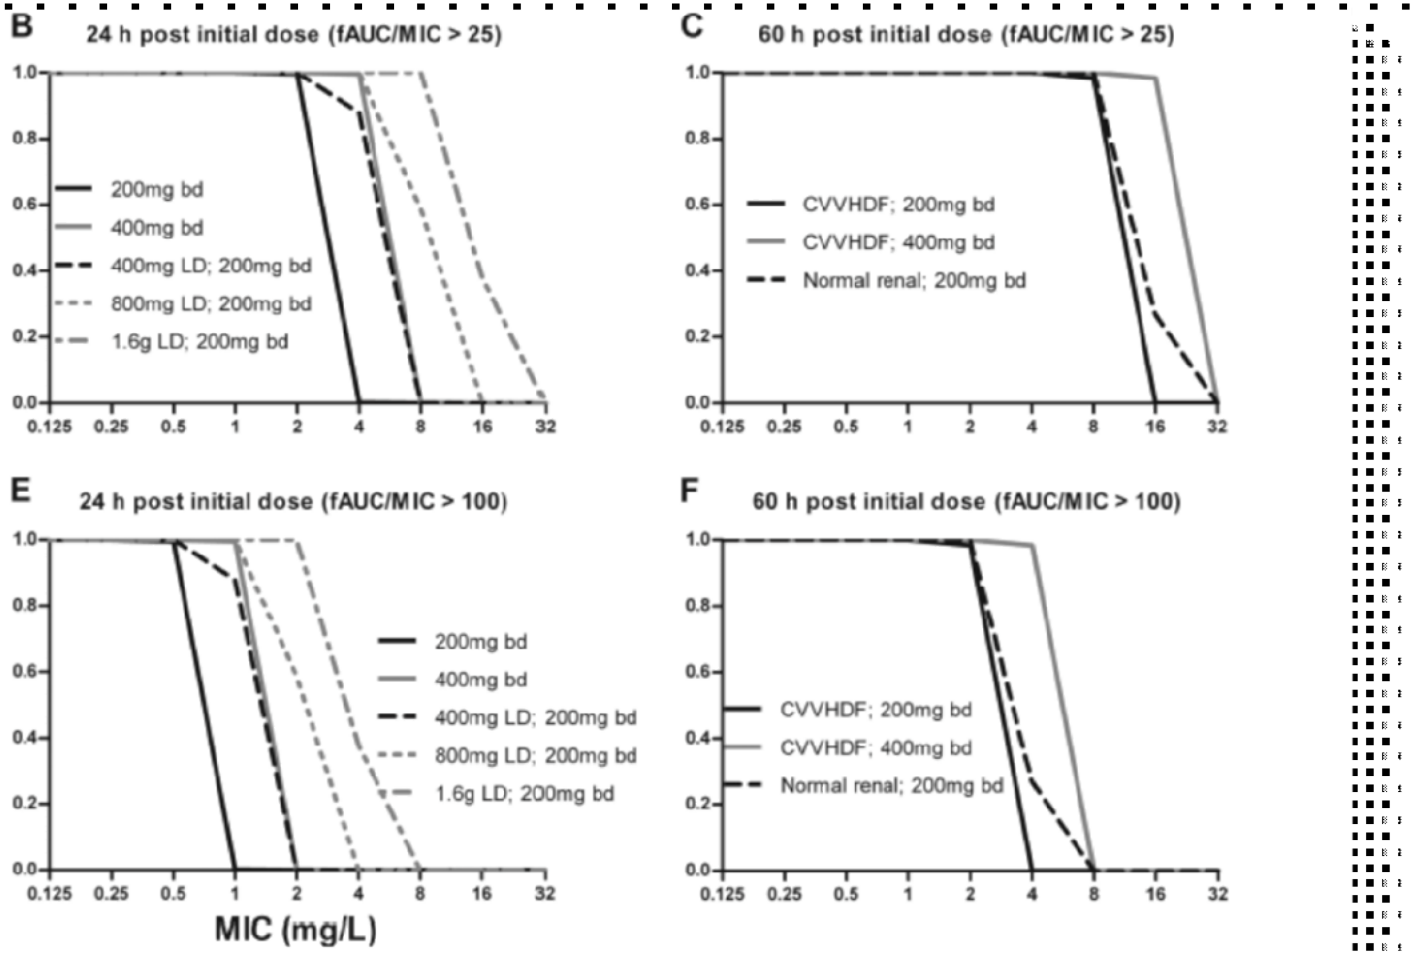


Daptomycin once-daily dosing is appropriate in patients undergoing CRRT.

ANTIMICROBIAL AGENTS AND CHEMOTHERAPY, Dec. 2011, p. 5868–5873

Population Pharmacokinetics of Fluconazole in Critically Ill Patients Receiving Continuous Venovenous Hemodiafiltration: Using Monte Carlo Simulations To Predict Doses for Specified Pharmacodynamic Targets▽

Kashyap Patel,[1] Jason A. Roberts,[2,3] Jeffrey Lipman,[2,3] Susan E. Tett,[1] Megan E. Deldot,[1] and Carl M. Kirkpatrick[1,4]*



Conclusions

- Loading dose only depends on:
  - Target plasma level
  - Vd
  - Not require adaptation
- No dosage adaptations:
  - High protein binding
  - Non renal elimination
- Increase of maintenance dose:
  - Clinical relevant CRRT removal

Conclusions

- β-lactams
  - Higher than recommended drug regimens to treat less susceptible GNB
  - Rapid adjustment of daily dose (48 hrs?)
  - Intensity of CRRT ? Continuous Infusion ?
- Aminoglycosides
  - Loading dose of at least 25 mg/kg
  - Dose adjustment on pathogen susceptibility (MIC)
  - TDM to avoid drug accumulation
- Vancomycin
  - Insufficient drug concentrations with standard regimens
  - CI > II ... but not better clinical response

Thank You !!!

We know everything about antibiotics except how much to give …

Maxwell Finland
