machtiging	prof. L. Van Bortel	voorzitter MFC

- Antibacteriële behandeling
 - **Milde tot matige infectie*:**
 - Eerste keuze bij de behandeling van een 1^e episode
 - Metronidazole (Flagyl)
 - volwassenen
 - 500 mg elke 8uur po, indien po onmogelijk: zelfde dosis IV.
 - Kinderen
 - 30mg/kg/dag (interval 6 uur, max dosis 2g/dag)
 - Bij intolerantie op metronidazole
 - Vancomycine PO (niet parenteraal)
 - Volwassenen
 - 125 mg elke 6 uur (magistrale bereiding van 125 mg beschikbaar) po of via nasogastrische sonde
 - Kinderen
 - 40mg/kg/dag (interval 6 uur, max 500 mg/dag)

Duur behandeling 10 tot 14 dagen

* leucocytose met WBC ≤ 15000 cellen/ml en serum creatinine ≤ 1,5 keer basiswaarde

2.5 Verdere infecties (te bespreken met multidisciplinair infectieteam)

- Herbevestiging diagnose
- Mogelijke behandeling
 - o Colestyramine (**Questran**) (4g elke 12 uur po) 2 tot 3 uur voor de afbouwdosis van vancomycine (zie boven)
 - o Probiotica (**Enterol**) (500mg elke 12uur *Saccharomyces boulardii*) in combinatie met vancomycine afbouwschema. Vermijden bij kritiek zieke patiënten, wegens risico op fungemie.
 - o Rifaximin po (**Xifaxan 500 mg comp**) (400 tot 800mg per dag, dosisinterval 8-12 uur) gedurende 14 dagen bij hardnekkige infecties (**niet terugbetaald door RIZIV**)
 - o Immuunoglobulines (400mg/kg eenmalig) (**niet terugbetaald door RIZIV**)
 - o Faecale bacteriotherapie, het toedienen van stoelgang van een gezonde donor via een nasogastrische sonde.

TABLE 1M

INFECTING ORGANISMS	PRIMARY CHOICE AND ALTERNATIVE ANTIMICROBIAL REGIMENS	COMMENTS
- In the majority of patients with CAP (including severe CAP) responding clinically well, antibacterial therapy can be safely discontinued at 7 days. See also ref 1M.188, ref 1M.189, ref 1M.190.		
Antibacterial agents. - Proposed regimens are for empirical treatment of immunocompetent patients and should be adapted to local epidemiology and comorbidities. * Adequately (highly) dosed betalactams still cover > 99% of strains of <i>Streptococcus pneumoniae</i> isolated in Belgium. High doses increase T>MIC and thus avoid the selection of intermediate susceptible or resistant strains of <i>Streptococcus pneumoniae</i> . * (Neo)macrolide ⁵ and azithromycin resistance in <i>Streptococcus pneumoniae</i> leads to therapeutic failures (ref 1M.191, ref 1M.192, ref 1M.193). * Few clinical data are available on the use of telithromycin in CAP. Telithromycin has in vitro activity against (neo)macrolide ⁵ and azithromycin resistant strains of <i>Streptococcus pneumoniae</i> [but telithromycin MIC values of such strains are higher than telithromycin MIC values of (neo)macrolide ⁵ and azithromycin susceptible strains]. Therefore its use should be strictly limited as mentioned below. * Because overuse of FQ ³ may lead to resistance, their use should be strictly limited as mentioned below. Moxifloxacin is the FQ ³ of choice because of its better in vitro activity against <i>Streptococcus pneumoniae</i> , its better pharmacodynamic properties when compared to other FQ ³ and because there is probably less resistance to moxifloxacin when compared to levofloxacin and ciprofloxacin. Treatment failures with levofloxacin due to resistance have been reported (ref 1M.194, ref 1M.195). Ciprofloxacin, levofloxacin (and ofloxacin) should never be used in monotherapy to treat CAP (MIC values too close to breakpoints and breakthrough bacteremias due to <i>Streptococcus pneumoniae</i> reported). * Some rare cases of severe hepatotoxicity have been reported with moxifloxacin and telithromycin (ref 1M.196). Currently the general consensus is to cover empirically <i>Streptococcus pneumoniae</i> (all CAP subgroups) and other (potentially betalactamase producing) Gram-positive and Gram-negative pathogens (CAP subgroups II, III and IV), but not to cover atypical pathogens [except in patients with CAP subgroup IV (ref 1M.197)]. - Sequential therapy (switching from iv to oral therapy within the same antibiotic class) is recommended in all cases (ref 1M.198).		
- Subgroup I (outpatient, no comorbidity). ◦ <i>Strep. pneumoniae</i> ◦ <i>Mycoplasma pneumoniae</i> ◦ respiratory viruses ◦ <i>Legionella</i> spp. ◦ <i>Chlam. psittaci</i> ◦ <i>Chlam. pneumoniae</i> ◦ <i>Coxiella burnetii</i>	Amoxicillin (HD ¹⁴).	In case of pneumonia due to <i>Mycoplasma pneumoniae</i> , fever may persist for 5 to 10 days. So, if no improvement occurs after 3 days of betalactam therapy, atypical pathogens may play a role: use of moxifloxacin or telithromycin or combining betalactams with [a (neo)macrolide ⁵ or azithromycin] may be considered. Because of efficacy of adequately dosed betalactams and risk of increasing resistance to FQ³, the initial use of moxifloxacin (ref 1M.199) and telithromycin should be strictly limited to patients with IgE mediated allergy to penicillins¹³ or major intolerance of amoxicillin.
- Subgroup II (outpatient, with comorbidity). ◦ <i>Strep. pneumoniae</i> ◦ <i>Haem. influenzae</i> ◦ <i>Staphylococcus aureus</i> ◦ <i>Klebsiella pneumoniae</i> ◦ other Gram-negative bacilli ◦ group A ¹⁵ streptococci ◦ respiratory viruses ◦ <i>Mycoplasma pneumoniae</i> ◦ <i>Chlam. pneumoniae</i> ◦ <i>Legionella</i> spp.	Amoxicillin-clavulanate (HD ¹⁴).	Age > 60 years has to be considered as comorbidity factor (ref 1M.200). The incidence of infection due to <i>Haemophilus influenzae</i> is higher in subgroup II than in subgroup I, hence the recommendation in this subgroup to combine amoxicillin with clavulanate. Telithromycin not recommended in this group because of moderate activity against <i>Haemophilus influenzae</i>. In patients with pneumonia due to <i>Mycoplasma pneumoniae</i> fever may persist for 5 to 10 days. So, if no improvement occurs after 3 days of betalactam therapy, atypical pathogens may play a role: use of moxifloxacin or combining betalactams with [a (neo)macrolide ⁵ or azithromycin] may be considered. Because of efficacy of adequately dosed betalactams and risk of increasing resistance to FQ³, the initial use of moxifloxacin (ref 1M.201) should be strictly limited to patients with IgE mediated allergy to penicillins¹³ or major intolerance to amoxicillin-clavulanate. Cefuroxime axetil (HD ¹¹) may be used as an alternative for amoxicillin-clavulanate po or moxifloxacin po [in a recent Belgian trial 82.3% of non invasive <i>Streptococcus pneumoniae</i> strains proved to be susceptible to cefuroxime axetil (ref

OTITIS MEDIA

Otitis media: acute.

- See also ref 1E.16, ref 1E.17, ref 1E.18, ref 1E.19, ref 1E.20, ref 1E.21, ref 1E.22, ref 1E.23, ref 1E.24, ref 1E.25, ref 1E.26.
- Since the introduction of the conjugated 7-valent (and 13-valent) vaccination against *Streptococcus pneumoniae* disease, non typeable *Haemophilus influenzae* (NTHI) and the pneumococcal serotypes not covered by the vaccines have become major pathogens in patients with acute otitis media. Non typeable *Haemophilus influenzae* is associated with recurrent acute otitis media but with less severe complications than infection due to *Streptococcus pneumoniae* (ref 1E.27).
 - **Spontaneous resolution** of symptoms may be expected in 90% of patients infected with *Moraxella catarrhalis* (ref 1E.28), in 50% of patients infected with *Haemophilus influenzae* and only in 20% of patients infected with *Streptococcus pneumoniae*.
 - **Use of antibacterials.**
 - * Use of antibacterials (except in children < 6 months of age) in the treatment of acute otitis media should be restricted as indicated below. Restricted use of antibacterials in this indication is associated with lower resistance rates and fewer side effects; its impact on the incidence of mastoiditis is controversial (ref 1E.29).
 - * In the setting of otitis media, recent exposure to antibacterials = exposure for ≥ 5 days in the course of the 28 days preceding onset of symptoms.
 - * Resistance of *Streptococcus pneumoniae* (middle ear isolates) is a major problem in Belgium (see table 3M) and therefore empirical use of (neo)macrolides⁵ and azithromycin is not indicated.
 - **Tympanocentesis** is indicated in case of toxicity, very severe otalgia or severe illness, if unsatisfactory response to antibacterial therapy, if associated with suspected or confirmed suppurative complications, if microbiology is unpredictable such as in sick neonates²² and immunocompromised patients.
 - No eardrops, no corticosteroids. Decongestion of the nose may be useful.

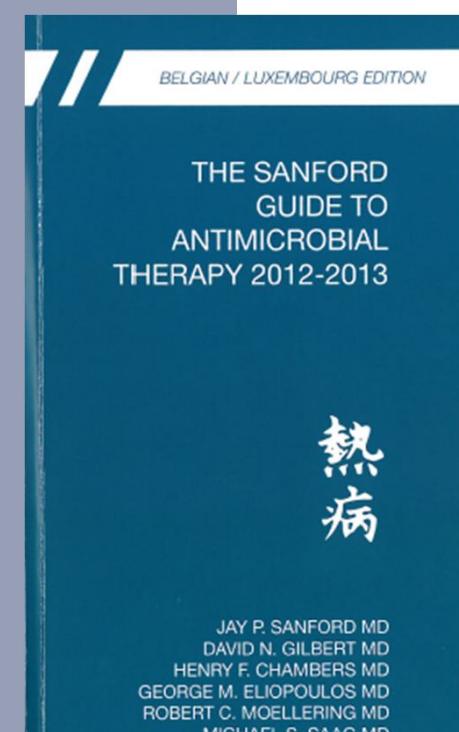

- Child ≥ 6 months of age.

<ul style="list-style-type: none"> ◦ respiratory viruses ◦ <i>Strep. pneumoniae</i> ◦ <i>Haem. influenzae</i> ◦ <i>Moraxella catarrhalis</i> ◦ <i>Staphylococcus aureus</i> ◦ group A¹⁵ streptococci 	<p>Watchful waiting: symptomatic treatment, no antibacterials for 48 hours unless child suffers from bilateral otitis media or otorrhea or is immunocompromised.</p> <p>In the latter cases:</p> <ul style="list-style-type: none"> - amoxicillin (HD¹¹) if child was not recently exposed to antibacterials. - [amoxicillin-clavulanate (HD¹¹) or cefuroxime axetil (HD¹¹)] if child was recently exposed to antibacterials. 	<p>Two recent placebo controlled trials in children (ref 1E.30, ref 1E.31) show benefit from antibacterial treatment (amoxicillin-clavulanate) as compared with placebo, although more side effects (future studies should identify patients who may derive the greatest benefit, in order to minimize unnecessary antimicrobial treatment and the development of bacterial resistance).</p> <p>If unsatisfactory response (no change in ear pain, persisting fever, bulging eardrum or otorrhea) after 48 to 72 hours of</p> <ul style="list-style-type: none"> - watchful waiting (ref 1E.32, ref 1E.33, ref 1E.34, ref 1E.35, ref 1E.36, ref 1E.37): <ul style="list-style-type: none"> * amoxicillin (HD¹¹) if no recent exposure to antibacterials. * amoxicillin-clavulanate (HD¹¹) or cefuroxime axetil (HD¹¹) if recent exposure to antibacterials. - antibacterial therapy with amoxicillin (HD¹¹): amoxicillin-clavulanate (HD¹¹) or cefuroxime axetil (HD¹¹). - antibacterial therapy with amoxicillin-clavulanate (HD¹¹) or cefuroxime axetil (HD¹¹): ceftriaxone and referral for tympanocentesis. <p>Empirical antibacterial therapy in patients with IgE mediated allergy to penicillins¹³: TMP-SMX⁸.</p> <p>Duration of empirical (+ documented) antibacterial therapy¹²: most of the guidelines (Europe and USA) recommend 5 to 10 days of treatment.</p>

The screenshot shows the 'Sanford Guide Web Edition 2' page. At the top, there's a navigation bar with links to Home, Syndromes, Pathogens, Anti-infectives, Prevention, Tables/Tools, Algorithms, Calculators, and Info. Below the navigation, a search bar and a user email address (janvancauwenbergh1@hotmail.com) are visible. To the right, there's a sidebar titled 'Also Available:' with icons for iOS Apps, Google Play, Print Editions, and Web Edition Membership. The main content area includes news about ID updates, recently published practice guidelines (mentioning IDSA and ASM joint guidelines and AAP guidelines for acute bacterial sinusitis), and drug safety information (mentioning FDA warnings for fluoroquinolones and Tigecycline).

Drawbacks

- ⇒ Lack of a homogenous distribution system, reaching the right target groups
- ⇒ Continued perceived association with pharma (e.g through distribution)
- ⇒ Lack of an electronic web based version, translated into apps + allowing regular updating

Drawbacks

- ⇒ Lack of a homogenous distribution system, reaching the right target groups
- ⇒ Continued perceived association with pharma (e.g through distribution)
- ⇒ Lack of an electronic web based version, translated into apps + allowing regular updating
- ⇒ No further agreement reached between BVIKM/SBIMC and Antimicrobial Therapy Inc
- ⇒ Initiative stopped

A new joint BAPCOC/BVIKM-SBIMC initiative

- ⇒ Existing BAPCOC guidelines for ambulatory use of antibiotics (general practice)
- ⇒ Within development of strategic plan for improving antimicrobial prescription/tackling resistance within BAPCOC (incl Working Group on Hospital Medicine), different goals:
 - ⇒ Development/implementation of similar BAPCOC guidelines for rational use of anti-infective agents within hospitals
 - ⇒ Reaching goals of implementation of guidelines (surgical prophylaxis, CAP,...)
 - ⇒ Auditing

A new joint BAPCOC/BVIKM-SBIMC initiative

- ⇒ **BAPCOC initiative**
- ⇒ **BVIKM/SBIMC in the role of independent scientific society producing a set of guidelines for FOD**
- ⇒ **Guidelines + app applications**
- ⇒ **1st version due 9.2015**

Are we successful in implementation of guidelines?

- ⇒ **BAPCOC audit in surgical prophylaxis (2013)**
- ⇒ **S aureus bacteremia (ABS studies)**
- ⇒ **CAP**

- ➲ General evaluation of current practice: retrospective
 - ➲ By discipline
 - ➲ 2 separate patient groups (obese and patients who are already being treated with antibiotics)

- ➲ 6 quality indicators
 - ➲ Indicator 1: administration of prophylaxis
 - ➲ Indicator 2: time of administration
 - ➲ Indicator 3: termination of prophylaxis within 24 hours
 - ➲ Indicator 4: administration of prophylaxis according to local guidelines
 - ➲ Indicator 5: non-administration of prophylaxis
 - ➲ Indicator 6: administration of repeat doses

Staphylococcus aureus bacteraemia: 3 indicators

- ➲ Number of patients who have undergone echocardiography (Trans-oesophageal echocardiography (=TEE) or Transthoracic echocardiography (TTE) within 10 days after SAB onset versus all community-onset SAB
- ➲ Patients who have their iv catheter (peripheral or central) present at SAB onset removed within 10 days after SAB onset versus patients with iv catheters in place at SAB onset (including confirmed and possible catheter-related infection)
- ➲ MSSAB patients receive ≥10 days of iv betalactam (penicillinase-stable in the case of penicillin resistance) therapy within 14 days of SAB onset versus all patients with MSSAB

Results Ghent University Hospital

Evaluatie van de diagnostiek en behandeling van bacteriëmie door *Staphylococcus aureus*

MINIMALE BEHANDELDUUR VAN 2 WEKEN VAAK NIET GEHAALD

Gijss W.D. Landman, Jolande W. Bouwhuis, Peter Bloembergen, Jan T.M. van der Meer, Paul H.P. Groeneveld

DOEL Een bacteriëmie met *Staphylococcus aureus* (SA-bacteriëmie) kan relatief mild verlopen, maar kan ook worden gecompliceerd door strooihaarden in botten, gewrichten, weke delen en het hart. De Infectious Disease Society of America (IDSA) adviseert bij elke SA-bacteriëmie een transoesophageal echocardiogram (TEE) te maken om endocarditis uit te sluiten en controlebloedkweken af te nemen 2-3 dagen na het starten van behandeling. Zowel de IDSA als de Stichting Werkgroep Antibiotica Beleid (SWAB) raden aan om patiënten met een SA-bacteriëmie ten minste 14 dagen intraveneus te behandelen en bij – verdenking op – een gecompliceerd beloop langer. In dit onderzoek wordt beschreven hoe vaak SA-bacteriëmie lege artis werd behandeld in een groot perifeer ziekenhuis.

OPZET Retrospectief cohortonderzoek.

METHODE Alle patiënten ouder dan 18 jaar bij wie in de periode november 2008-oktober 2009 uit het bloed *S. aureus* was gekweekt, werden retrospectief geïdentificeerd met het elektronische registratiesysteem van het Laboratorium voor Medische Microbiologie en Infectieziekten.

RESULTATEN Er werden 93 patiënten met SA-bacteriëmie geïncludeerd. De mediane follow-up-tijd was ≥ 3 maanden. Bij 48 van de 81 patiënten (60%) die langer dan 1 week leefden na binnenkomst in het ziekenhuis werd geen TEE gemaakt. Controlebloedkweken op dag 3 werden slechts bij 6 patiënten (6%) verricht. Van de 79 patiënten (85%), die de eerste 2 weken overleefden, werden er 26 (33%) korter dan 14 dagen intraveneus met antibiotica behandeld. Een recidief SA-bacteriëmie trad op bij 4 patiënten (4%).

CONCLUSIE Het merendeel van de patiënten met een SA-bacteriëmie kreeg niet de diagnostiek en behandeling conform de richtlijnen van de IDSA en SWAB.

NED TIJDSCHR GENEESKD. 2011;155:A3376

A) Sepsis met vermoeden van een Gram-positieve infectie

1. Hemoculturen afnemen
2. Empirische antibioticatherapie opstarten
 - beta-lactam
 - beta-lactam in combinatie met vancomycine i.g.v.
 - kritisch zieke patiënten
 - patiënten met een verhoogd risico voor MRSA-infecties

B) Positieve hemoculturen voor *Staphylococcus aureus*

Richtlijnen voor de behandeling van *Staphylococcus aureus* bacteriëmie (SAB)

Kernboodschappen

De drie to do's bij SAB zijn:

- Geef een correcte intraveneuze antibioticatherapie en behandel minstens 2 weken
- Verwijder de aanwezige intravasculaire catheters
- Sluit endocarditis uit door een transoesofageale echocardiografie (TEE) tussen dag 10 en 14 van IV antibiotherapie

Staphylococcus aureus bacteriëmie gaat gepaard met een hoge mortaliteit en morbiditeit. *Staphylococcus aureus* veroorzaakt 20% van alle intravasculaire catheter-gerelateerde bacteriëmies of bloedstroominfectie (BSI) en 35% van alle endocarditis gevallen. De mortaliteit voor BSI met MRSA simoneert zich tussen 20 en 30%. Er zijn drie belangrijke risicofactoren voor een slechte prognose, die we kunnen beïnvloeden, nl. het niet identificeren van uitgezaaide of strooi-infectie (vb. endocarditis), het niet verwijderen van catheters en een niet-correcte antibiotica-behandeling. Andere niet modificeerbare risicofactoren zijn co-morbiditeit, betalactam resistentie, community acquisition en initiale presentatie met septische shock.

SAB dient uitdrukkelijk, zelfs bij een gunstige klinische evolutie met verdwijnen van koorts na het verwijderen van de catheters, gedurende minstens 2 weken met intraveneuze antibiotica behandeld te worden. Een kortere behandelingstijd gaat gepaard met een verhoogd risico op ernstige verwikkelingen, zoals septische artritis, spondylodiscitis en endocarditis (vormen van strooi-infectie). Een TEE is nodig om endocarditis uit te sluiten en is veel gevoeliger dan transthoracale echocardiografie. De echocardiografie mag evenwel niet te vroeg gepland te worden om een beperkte afwijking in de beginfase niet te missen (te plannen binnen het tijdsvenster van 10 tot 14 dagen na opstarten antibiotherapie). Indien er een klinisch vermoeden van endocarditis bestaat, dient de TEE zo snel mogelijk te gebeuren. Diagnoses zoals endocarditis en andere vormen van strooi-infectie verplichten tot een langere behandelingstijd van 4 tot 6 weken.

In 2007 nam het UZ Gent deel aan een multicentrische retrospectieve studie (ABS studie) waar drie kwaliteitsindicatoren werden geëvalueerd die peilen naar de modificeerbare risicofactoren.

- Indicator 1. Percentage patiënten met community-SAB die een echocardiografie ondergingen binnen de 10 dagen na SAB aanvang
- Indicator 2. Percentage patiënten bij wie de katheter werd verwijderd binnen de 10 dagen na SAB aanvang.
- Indicator 3. Percentage MSSA-gemisteerde patiënten die minstens 10 dagen behandeld werden met IV betalactam antibiotica en dit binnen de 14 dagen na SAB aanvang.

Er werden 500 bloedstroominfecties met *S. aureus* geïdentificeerd in 9 ziekenhuizen (3 in Oostenrijk, 2 in België, 1 in Tsjechië, 2 in Duitsland en 1 in Slovenië). De evaluatie werd in 2009 herhaald in het UZ Gent. In Figuur 1 zijn de resultaten van de globale ABS-studie 2007, de UZGent data 2007 en de UZGent data 2009 weergegeven.

EIT

Divergent intentions to use antibiotic guidelines

- ⇒ Identification of barriers to and facilitators of guideline adherence and assessment of relative importance
- ⇒ Guideline use fueled by 3 factors (planned behavior therapy)
 - ⇒ Attitude
 - ⇒ Subjective norm (perceived social pressure regarding guidelines)
 - ⇒ PBC perceived behavioral control: perceived ability to follow guidelines
- ⇒ Questionnaire based + additional measure of habit strength
- ⇒ 50 % response rate in major teaching hospital (195/393)

(Cortoos et al Med Decis Making 2012; 32: 145)

CORTOOS AND OTHERS

Table 3 Hierarchical Regression Analysis: Standardized Regression Coefficients and R^2

Variables	Model 1 ($R^2 = .041$)	Model 2 ($R^2 = .104$)	Final Model ($R^2 = .134$)	Relative Weight
Position ^a	.257*	.233	.223	.035
Age	.244*	.189	.163	.037
Gender ^b	.079	.060	.039	.068
Frequency ^c	-.086	-.063	-.077	.032
Attitude	—	.058	.048	.043
Subjective norm	—	.037	-.027	.040
PBC ^d	—	.221**	.178*	.354
Habit	—	—	.197*	.391

N = 184. Relative weight for each variable expressed as a fraction of R^2 .²⁴ PBC, perceived behavioral control.

^a1 = staff member; 2 = resident.

^b1 = male; 2 = female.

^cAverage prescribing frequency of antibiotics per week: 1 = never; 2 = 1–2 times; 3 = 3–4 times; 4 = daily.

^dThree-item construct used for analysis; excluded items = question 25 ("Whether I use the local guidelines for my patients during the next year is entirely up to me") and question 26 ("The decision to use the local guidelines for my patients during the next year is beyond my control").

* $P < 0.05$. ** $P < 0.01$.

DIVERGENT INTENTIONS TO USE ANTIBIOTIC GUIDELINES

Table 4 Regression Analysis Models with Position as Moderator: Standardized Regression Coefficients and R^2

Position	Variables	Model 1 ($R^2 = .053$)	Model 2 ($R^2 = .092$)	Final Model ($R^2 = .152$)	Relative Weight
Staff member ($n = 79$)	Age	.218	.155	.151	.170
	Gender ^a	.113	.099	.125	.068
	Frequency ^b	-.064	-.025	-.049	.021
	Attitude	—	.015	.020	.017
	Subjective norm	—	-.024	-.111	.028
	PBC ^c	—	.212	.107	.226
	Habit	—	—	.295*	.470
Resident ($n = 105$)	Independent Variables	Model 1 ($R^2 = .020$)	Model 2 ($R^2 = .130$)	Final Model ($R^2 = .141$)	Relative Weight
	Age	-.016	.027	.016	.001
	Gender	.042	.024	-.002	.014
	Frequency	-.129	-.107	-.116	.068
	Attitude	—	.114	.101	.157
	Subjective norm	—	.096	.053	.108
	PBC ^c	—	.244*	.228*	.426
	Habit	—	—	.123	.226

Standardization of the coefficients has been done within each separate group. Relative weight for each variable expressed as a fraction of R^2 .²⁴ PBC, perceived behavioral control.

^a1 = male; 2 = female.

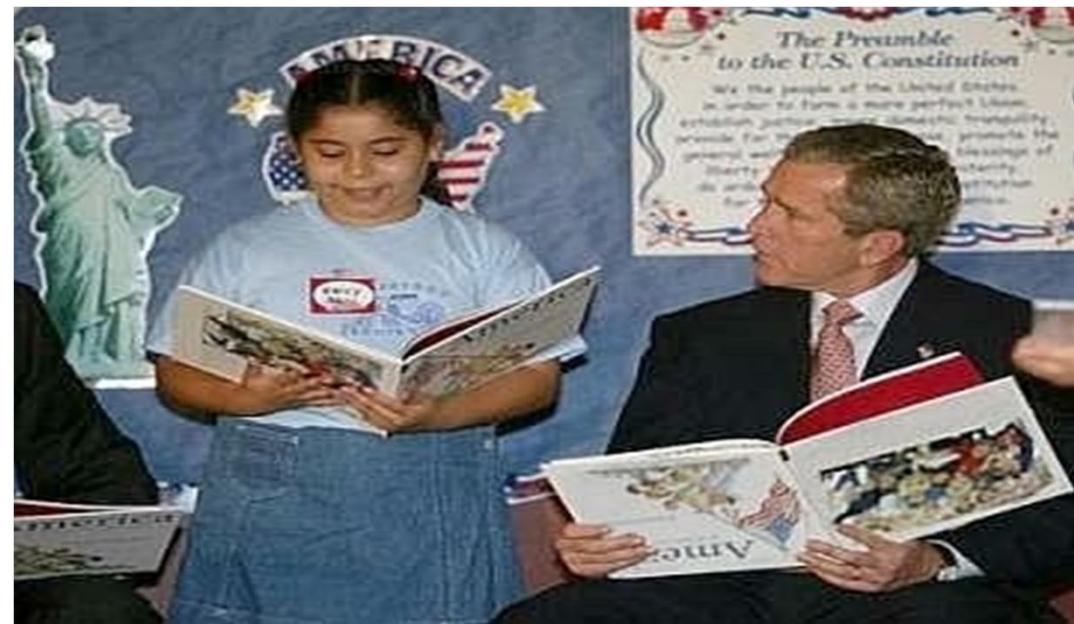

^bAverage prescribing frequency of antibiotics per week: 1 = never; 2 = 1–2 times; 3 = 3–4 times; 4 = daily.

^cThree-item construct used for analysis; excluded items = question 25 ("Whether I use the local guidelines for my patients during the next year is entirely up to me") and question 26 ("The decision to use the local guidelines for my patients during the next year is beyond my control").

* $P < 0.05$.

From writing to implementation of guidelines

- >Create the conditions for guidelines to be read (format, clear messages,...): “for dummies”

ANALYSIS

Breaking the rules: understanding non-compliance with policies and guidelines

Healthcare organisations use policies and guidelines to standardise and clarify care and improve efficiency, productivity, and safety. But Jane Carthey and colleagues are concerned that their burgeoning number makes it impossible to distinguish the essential from the irrelevant and is affecting compliance

Jane Carthey *human factors consultant*¹, Susannah Walker *anaesthetic registrar*², Vashist Deelchand *research associate*², Charles Vincent *professor of clinical safety research*², William Harrop Griffiths *consultant anaesthetist*³
